ABSTRACT

LOLO is a superposition test that observes a star field with and without an added flatfield pedestal added, to help retrieve the detector non-linearity.

OBSERVING DESCRIPTION

For this MRT, we observe only one target, NGC6819, which is a stellar cluster in the Kepler field. It offers good number density of stars while maintaining good separation between nearest neighbors.

	Comments: This object was generated by the targetselector and retrieved from the SIMBAD database.				
	SIMBAD listed proper motion for this target. When retrieving targets with PM from SIMBAD, APT requests the coordinates be calculated with an epoch of the year 2000. Do not modify this epoch. Always review coordinates using the Target Confirmation tool, which graphically displays the PM.
